1	Simultaneous Equations	1
2	Graphical Solution	2
3	C programming	3
4	C programming exercises	5

**Abstract**—This manual introduces Python and C programming through basic geometry.

## 1 SIMULTANEOUS EQUATIONS

### 1.1 Consider the equations

$$x_1 + x_2 = 8 \quad (1)$$

$$3x_1 - x_2 = 12 \quad (2)$$

Write (1) as a matrix equation.

**Solution:** (1) can be expressed as

$$\begin{pmatrix} 1 & 1 \\ 3 & -1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = \begin{pmatrix} 8 \\ 12 \end{pmatrix} \quad (3)$$

### 1.2 Let

$$\mathbf{A} = \begin{pmatrix} 1 & 1 \\ 3 & -1 \end{pmatrix} \quad (4)$$

Find  $\det(\mathbf{A})$ .

**Solution:** The *determinant* is obtained as

$$\det(\mathbf{A}) = 1 \times -1 - 3 \times 1 = -4. \quad (5)$$

### 1.3 Write a program for finding $\det(\mathbf{A})$ .

**Solution:** The following program finds the determinant.

\*The author is with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in. All content in this manual is released under GNU GPL. Free and open source.

```
#Code by GVV Sharma
#March 14, 2019
#released under GNU GPL
import numpy as np
```

```
a1 = 1
a2 = 1
b1 = 3
b2 = -1
c1 = 8
c2 = 12
```

```
A = np.array([[a1,a2],[b1,b2]])
x = np.linalg.det(A)
print(x)
```

### 1.4 Write your own function for calculating $\det \mathbf{A}$

**Solution:** The following routine finds the determinant.

```
#Code by GVV Sharma
#March 14, 2019
#released under GNU GPL
import numpy as np
```

```
def det(A):
    a1 = A[0][0]
    a2 = A[0][1]
    b1 = A[1][0]
    b2 = A[1][1]
    y = a1*b2 - a2*b1
    return y
```

```
a1 = 1
a2 = 1
b1 = 3
b2 = -1
```

```
A = np.array([[a1,a2],[b1,b2]])
```

```
x = det(A)
print(x)
```

1.5 Write a program to check if two lines intersect.

**Solution:** Two lines intersect if  $\det(\mathbf{A}) \neq 0$ .  
The following code checks for this condition.

```
#Code by GVV Sharma
#March 16, 2019
#released under GNU GPL
import numpy as np

a1 = 1
a2 = 1
b1 = 3
b2 = -1

A = np.array([[a1,a2],[b1,b2]])
x = np.linalg.det(A)
if x != 0:
    print('The lines intersect')
else:
    print('The lines do not intersect')
```

1.6 Find  $\mathbf{A}^{-1}$ .

**Solution:** The *inverse* of  $\mathbf{A}$  is obtained as

$$\mathbf{A}^{-1} = \frac{1}{\det \mathbf{A}} \begin{pmatrix} -1 & -1 \\ -3 & 1 \end{pmatrix} \quad (6)$$

$$= \frac{1}{-4} \begin{pmatrix} -1 & -1 \\ -3 & 1 \end{pmatrix} = \frac{1}{4} \begin{pmatrix} 1 & 1 \\ 3 & -1 \end{pmatrix} \quad (7)$$

1.7 Write your own function for calculating  $\mathbf{A}^{-1}$

1.8 Let

$$\mathbf{c} = \begin{pmatrix} 8 \\ 12 \end{pmatrix} \quad (8)$$

Find  $\mathbf{A}^{-1}\mathbf{b}$

**Solution:** From (6) and (8),

$$\begin{aligned} \mathbf{A}^{-1}\mathbf{b} &= \frac{1}{4} \begin{pmatrix} 1 & 1 \\ 3 & -1 \end{pmatrix} \begin{pmatrix} 8 \\ 12 \end{pmatrix} \\ &= \frac{1}{4} \begin{pmatrix} 1 \times 8 + 1 \times 12 \\ 3 \times 8 - 1 \times 12 \end{pmatrix} = \frac{1}{4} \begin{pmatrix} 20 \\ 12 \end{pmatrix} = \begin{pmatrix} 5 \\ 3 \end{pmatrix} \end{aligned} \quad (10)$$

1.9 Verify that (10) is a solution of (1).

1.10 Write a program to find the solution of (1).

**Solution:** The following program finds the solution

```
#Code by GVV Sharma
#March 14, 2019
#released under GNU GPL
import numpy as np
```

```
a1 = 1
a2 = 1
b1 = 3
b2 = -1
c1 = 8
c2 = 12
```

```
A = np.array([[a1,a2],[b1,b2]])
c = np.array([c1,c2])
Ainv = np.linalg.inv(A)
x = np.matmul(Ainv,c)
```

```
print(x)
```

1.11 Write your own program for **np.matmul**.

## 2 GRAPHICAL SOLUTION

2.1 Find a graphical solution for (1).

**Solution:** The following code plots Fig. 2.1. It is obvious that the two equations in (1) represent the lines  $y_1$  and  $y_2$  in Fig. 2.1 and intersect at  $\begin{pmatrix} 5 \\ 3 \end{pmatrix}$

```
#Code by GVV Sharma
#March 14, 2019
#released under GNU GPL
import numpy as np
import matplotlib.pyplot as plt
```

```
#if using termux
import subprocess
import shlex
#end if
```

```
x = np.linspace(-2,8,20)
y1 = 8-x
y2 = 3*x-12
```

```
fig = plt.figure()
ax = fig.add_subplot(1, 1, 1)
```

```
# Major ticks every 2, minor ticks every 1
major_ticks = np.arange(-10, 10, 2)
minor_ticks = np.arange(-10, 10, 1)
```

Fig. 2.1

```
ax.set_xticks(major_ticks)
ax.set_xticks(minor_ticks, minor=True)
ax.set_yticks(major_ticks)
ax.set_yticks(minor_ticks, minor=True)

# If you want different settings for the grids:
ax.grid(which='minor', alpha=0.2)
ax.grid(which='major', alpha=0.5)

#Plotting all lines
ax.plot(x,y1,label='$y_1$')
ax.plot(x,y2,label='$y_2$')

plt.xlabel('$x$')
plt.ylabel('$y$')
ax.legend(loc='best')

#if using termux
plt.savefig('../figs/draw_line.pdf')
plt.savefig('../figs/draw_line.eps')
subprocess.run(shlex.split("termux-open ../figs/draw_line.pdf"))
#else
plt.show()
```

- 2.2 The **np.linspace** function above generates an arithmetic sequence with first term -2, last term 8 and number of terms 20. Write your own linspace function and verify.

**Solution:** The code is available below.

```
#Code by GVV Sharma
```

```
#March 14, 2019
#released under GNU GPL
import numpy as np
```

```
def linspace(first,last,k):
    t= np.zeros((k,1))
    t[0]=first
    d = (last-first)/(k-1)
    for n in range(2,k):
        t[n-1] = t[0]+(n-1)*d
    return t
```

```
x = np.linspace(-2,8,20)
print(x)
```

### 3 C PROGRAMMING

- 3.1 Write a C program to generate an arithmetic sequence with  $t_0 = -2, t_{n-1} = 8, n = 20$  and print it to the file **ap.dat**.

**Solution:**

```
#include <stdio.h>

int main(void)
{
    FILE *fp;
    float t_0 = -2.0, t_k = 8.0, d, t_n;
    int k = 20, n;

    //Common difference
    d = (t_k-t_0)/(k-1);
    fp = fopen("ap.dat","w");
    for(n = 0; n < k; n++)
    {
        t_n = t_0+n*d;
        printf("%f\n",t_n);
        fprintf(fp,"%f\n",t_n);
    }
    fclose(fp);
    return 0;
}
```

- 3.2 Now execute the following code.

```
#Code by GVV Sharma
#March 15, 2019
#released under GNU GPL
import numpy as np
import matplotlib.pyplot as plt
```

```

#if using termux
import subprocess
import shlex
#endif if

x = np.loadtxt('ap.dat',dtype='float')
y1 = 8-x
y2 = 3*x-12

fig = plt.figure()
ax = fig.add_subplot(1, 1, 1)

# Major ticks every 2, minor ticks every 1
major_ticks = np.arange(-10, 10, 2)
minor_ticks = np.arange(-10, 10, 1)

ax.set_xticks(major_ticks)
ax.set_xticks(minor_ticks, minor=True)
ax.set_yticks(major_ticks)
ax.set_yticks(minor_ticks, minor=True)

# If you want different settings for the grids:
ax.grid(which='minor', alpha=0.2)
ax.grid(which='major', alpha=0.5)

#Plotting all lines
ax.plot(x,y1,label='$y_1$')
ax.plot(x,y2,label='$y_2$')

plt.xlabel('$x$')
plt.ylabel('$y$')
ax.legend(loc='best')

#if using termux
plt.savefig('../figs/draw_line.pdf')
plt.savefig('../figs/draw_line.eps')
subprocess.run(shlex.split("termux-open ../figs/draw_line.pdf"))
#else
#plt.show()

```

- 3.3 Do all computations in Problem 2.1 using C and store the data into files. Import this data so that Python is used only for plotting.

- 3.4 Write a function for computing the common difference  $d$  given  $t_0, t_{n-1}$  and  $n$ .

**Solution:**

```
#include <stdio.h>
```

```

float comm_diff(float,float,int);
int main(void)
{
FILE *fp;
float t_0 = -2.0, t_k = 8.0, d,t_n;
int k = 20, n;

//Common difference
d = comm_diff(t_0,t_k,k);
fp = fopen("ap.dat","w");
for(n = 0; n < k; n++)
{
t_n = t_0+n*d;
printf("%f\n",t_n);
fprintf(fp,"%f\n",t_n);
}
fclose(fp);
return 0;
}

float comm_diff(float first,float last,int n)
{
float d;
d = (last-first)/(n-1);
return d;
}

```

- 3.5 Write a C program to find  $\det(\mathbf{A})$ .

**Solution:**

```

#include <stdio.h>
#include <stdlib.h>

//This program shows how to use pointers as
//2-D arrays

//Function declaration
double **createMat(int m,int n);
//End function declaration

int main() //main function begins
{

//Defining the variables
int m,n;//integers
double **A,det;

printf("Enter the size of the matrix m_n\n");
scanf("%d%d", &m,&n);

```

```

A = createMat(m,n);//creating the matrix a
A[0][0] = 1;
A[0][1] = 1;
A[1][0] = 3;
A[1][1] = -1;

det = A[0][0]*A[1][1]-A[0][1]*A[1][0];
printf("%f\n",det);
free(A);
return 0;
}

//Defining the function for matrix creation
double **createMat(int m,int n)
{
    int i;
    double **a;

    //Allocate memory to the pointer
    a = (double **)malloc(m * sizeof( *a));
    for (i=0; i<m; i++)
        a[i] = (double *)malloc(n * sizeof(
            *a[i]));

    return a;
}
//End function for matrix creation

```

#### 4 C PROGRAMMING EXERCISES

- 4.1 Write a program to find  $\mathbf{A}^{-1}$  and print it.
- 4.2 Write a function to print  $\mathbf{A}^{-1}$ .
- 4.3 Write a function to find  $\mathbf{A}^{-1}$ .
- 4.4 Write a program to find  $\mathbf{A}^{-1}\mathbf{c}$ .
- 4.5 A geometric sequence is defined as

$$t_{n-1} = t_0 r^{n-1} \quad (11)$$

Write a function for generating a geometric sequence from  $t_0$ ,  $r$  and  $n$ .

- 4.6 Write a program to find the sum of the first  $n$  terms of an arithmetic sequence.
- 4.7 Write a program to find the sum of the first  $n$  terms of a geometric sequence.
